

Asset Management System

Update on Requested Corrections · 08-10-2026

Summary

All corrections listed in your document “Queries in software” have been implemented and tested. Existing records are carried over automatically, with no data re-entry needed.

The main additions are an optional RFID code, PIR/DIR/IIR inventory types, automatic SL No. and Transaction ID, accessories under a main item, a new Verification of Assets module, two-stage gate-pass approval with rejection, and date-wise reports.

A few points need your confirmation; they are listed at the end of this document.

Asset registration

Your request	What has been done
Asset Code to become a non-mandatory RFID code	The field is now “RFID code” and is optional, so it can be added later. Until it is filled, the asset is identified by its Transaction ID.
Add “Type of inventory” after Asset Code	A required drop-down with PIR, DIR and IIR, placed directly after the RFID code.
SL No. to be auto-generated	SL No. is assigned automatically when the asset is saved. Existing assets without one have been numbered.
Transaction ID auto-generated as dd-mm-yyyy + number	Generated automatically, for example 07-10-2026-0001. The number restarts each day.
Calendar near the date; no lengthy scrolling	Every date field is now short, in dd-mm-yyyy format, with the calendar button right beside it.
Calendar navigation year-wise	The calendar has month and year drop-downs and buttons to move a full year back or forward. This applies everywhere, including the Employee master.
Current status values; “Assigned” to read “Issued”	The list is: In stock, Issued, Outside premises, Return pending, Under disposal, Disposed, Written Off, Passed Out.
Accessories as sub-parts of the main item	An asset can now be linked to a main item. Each asset page has an “Add accessory” button (for a monitor, keyboard, etc.), which pre-fills the form from the main item. The accessory keeps its own serial number and is listed under the main item.

Procurement, stock and installation

Your request	What has been done
Amount / Unit rate	The field is labelled “Amount / Unit rate”.
Bill value in dollar, euro and yen as well as rupee	A Currency field (Rupee, US Dollar, Euro, Yen) applies to both the unit rate and the bill value. Reports total each currency separately.
Add DRR No., DRR Date, GRIN No., GRIN Date	All four fields are added to the Procurement section.
Status of asset as Working / Not working	Now a drop-down with Working and Not working.

Your request	What has been done
Whether a log book is maintained	A “Log book maintained” Yes/No field is added.

Transfer and return of assets

Your request	What has been done
Search bar instead of choosing from a long list	The asset, location and employee fields each have a type-to-search box.
Display asset details	As soon as an asset is chosen, a panel shows its details, location, custodian and accessories.
Centres: RCED Kolkata, Kanpur, Jalandhar, Ahmedabad	A Centre master is added with these four centres. Buildings belong to a centre.
Capture building and room changes	Each movement records the building and room before and after.
Movement to include PIR/DIR, division, location and name changes	A transfer can change the PIR/DIR type and the division. Every movement lists exactly what changed, for example “PIR/DIR: PIR → DIR” or “Room: 101 → 202”.
“Transferred date” instead of “Movement date”	Renamed throughout.
Transferring / returning accessories	Accessories move with their main item by default, and can also be transferred or returned on their own.
Return module fields (Return yes/no, returned stock, return from name, voucher no. and date, return clause, return from division)	The Return form now has all these fields. Return clause is a drop-down with Surplus, Obsolete and Unserviceable.

Disposal

Your request	What has been done
Stores return tab: Surplus / Obsolete / Unserviceable	A new “Stores returns” tab lists items returned to stores with their return clause. It can be filtered by clause.
Return-to-lot classification for the Stores section only	Only Stores users can assign returned items to a disposal lot. For other users the lot field is read-only.
“Save” instead of “Create proposal”	The button now reads “Save”.

Verification of assets (new module)

A new Verification menu records whether each asset is available or not available during physical checks. This completes the four main modules you listed: asset adding, transfer, return and verification.

- 1 Choose a location and the verification date.
- 2 The system lists every asset expected at that location.
- 3 Mark each one Available or Not available, with an optional remark. A “Mark all available” button speeds this up.
- 4 Save. The results appear in the Verification of Assets report and on each asset’s page.

The report can be filtered by date range, result and location, and downloaded as a spreadsheet (CSV).

Gate pass

Gate passes now go through division approval and then Stores approval, and either can reject. The steps are:

- 1 The employee requests a gate pass. Only items registered in their own name or their division are listed, with a search box to find them.
- 2 The division admin approves or rejects it.
- 3 Stores approves or rejects it.
- 4 Security marks the items outward, and inward on return for temporary passes.

A rejection requires a reason, which is shown on the gate pass with the name of the person who rejected it and the time. Marking outward and inward is now reserved for Security users only.

Masters

Your request	What has been done
Employee master: Date of Joining and Date of Retirement	Both dates are added. Each employee can also be linked to their login account, which the gate pass uses to show only their items.
Location master: "Current Location" instead of Name, as a drop-down	Current location is chosen from a new "Current place / location" list. Existing location names have been added to that list.
Room No. as a drop-down	Rooms are kept in their own list under each building and chosen from a drop-down.
Building Name as a drop-down	A Building master is added; each building belongs to a centre.
Budget Master, Budget classification, Project Code	All three masters are added and can be selected in the Procurement section of an asset.

Reports

A new Asset Reports page generates reports for any date range you choose. The dates can be based on registration date, NC date, bill date or installation date.

- **View PIR / DIR:** filter by PIR, DIR or IIR.
- **Grouping:** employee-wise, division-wise, room-wise or location-wise, as requested. Building-wise, centre-wise and status-wise are also available.
- **Other filters:** status, employee, division, centre, building and location.
- **Download:** every report can be downloaded as a spreadsheet (CSV) with the same filters applied.

The Verification of Assets report is described in the Verification section above.

Points for your confirmation

- **Centre names:** we have used “RCED Kolkata”, “RCED Kanpur”, “RCED Jalandhar” and “RCED Ahmedabad”. Please confirm the exact names.
- **PIR / DIR / IIR:** these appear as the short codes. Let us know if you would like the full names shown as well.
- **Return to lot classification:** we have taken this to mean that only Stores can assign returned items to disposal lots. Please confirm.
- **Import template:** the current Excel template has been updated with the new fields as an interim version. Once you share the official template, it will become the template for all future uploads.

Before use

- 1 Link each employee to their login account in the Employee master, so the gate pass shows only their items.
- 2 Assign division heads to the new “Division Administrator” role, so they can approve or reject gate passes.
- 3 Add buildings, rooms and current places / locations in the masters, then select them in each location.
- 4 Add Budget, Budget classification and Project Code entries if they are to be recorded with procurements.
